Category:	
Description Hi, on my parabola server I installed libvirt, qemu-headless and qemu-headless-arch-extra. I connected to it trough my parabola laptop,with virt-manager. After connecting to the server, I clicked on "create a new virtual machine" I then selected local install media (ISO image or cdrom) When messing with OS type and version, many non-FSDG compliant GNU/Linux distributions(like Ubuntu 16.04) and operating system (Microsoft Windows 10) are shown. Denis.

Is testing non-free software in a VM a freedom issue? But I understand the idea about not promoting it.
