Description As you may know in libretools you can install and upgrade packages without having to run chroot manually, with the functions like <code>install-name</code> (for <code>pacman -S</code>), <code>update</code> (for <code>pacman -Syu</code>), etc. It would be useful if there were also functions like <code>'pacman -S --force'</code> , <code>'pacman -R'</code> and <code>'pacman -Rdd'</code> , sometimes I've had to run manually chroot for doing this, but then I thought that they could be implemented in libretools. Please, integrate them in the next releases.	

History

I was actually toying with the idea of removing `install-name` and `update`. In the past, they required special handling, but now they are just aliases for `run pacman -S` and `run pacman -Syu`.

What about if I just let them each take flags?
