Description			
<p>I have tested different TCPStealthSecret on server and client side but it ignores it and always accept to connect. To confirm I don't have an issue on my kernel (I am using linux-libre-grsec-knock) I have use the simple program Gnunet proposed on their website (https://gnunet.org/sites/default/files/examples.tar.gz) and it is working as expected (different secrets makes the connection fails, same secret validate the connection).</p>

Doing further analysis, the patch doesn't seems to define TCP_STEALTH_SECRET on the right place.

The sample program from Gnunet gives 0x1e for setsockopt:

```
setsockopt(3, SOL_TCP, 0x1e /* TCP_??? */, "thisismysecret\0\0\0\0\0\0\0\0\0\0\0\0\0\0...", 64) = 0
```

and the knock process is working correctly.

The same `setsockopt` from the `openssh-knock` is doing:

```
setsockopt(3, SOL_TCP, TCP_NOTSENT_LOWAT,"thisismysecret\0\0\0\0\0\0\0\0\0\0\0\0\0\0\0...", 64) = 0
```

and the knock process is not working (ssh always accept connection even if secret are not the same between client and server)

I confirm this behavior. It was so for a long time already.

- Status changed from open to fixed

#5 - 2017-04-12 04:18 PM - belette

Yep I confirmed it is fixed

many thanks @Emulatoreman for your quick fix :)
