[mesa] /etc/drirc is a broken symlink

Description In package_mesa(), the PKGBUILD runs <code>cp -rv \${srcdir}/drirc \${pkgdir}/etc</code> ; but because <code>\${srcdir}/drirc</code> is a symlink (to <code>\${startdir}/drirc</code>), it copies the symlink itself instead of the file being pointed to. The culprit is the <code>-r</code> flag; without that flag it will copy the file being pointed to.
