

## Packages - Freedom issue #1755

### [asp] Links to Arch source repositories instead of Parabola ones

<b>Description</b> Source code contains URLs to Arch Linux source repositories, so it works with sources of Arch packages not Parabola.  Steps to reproduce: 1. pacman -S asp. 2. asp checkout doublecmd-qt5 (or any other package name from libre which replaces the Arch package). 3. Verify the output.  Expected results: asp package is either removed from Parabola or replaced by the appropriate package in libre that uses Parabola source repos, and so outputs from those. libre replacement should probably be renamed to psp or something like that, because I guess "a" in asp stands for Arch (not 100% sure about that).  Actual results: Prints the address of Arch source repository to stdout and also checks out the sources of the package from that repository.
