Category:	
Description	
On step 8 of the Beginner's Guide: [[https://wiki.parabola.nu/Beginners%27_Guide#Beginners]], the user is guided through installing the base system.	
An error will transpire if the user doesn't initialize the pacman keyring for arch & parabola.	
The fix for it would be to include that the user should run the following 3 commands:	
pacman-key --init pacman-key --populate archlinux pacman-key --populate parabola

are you installing from a Parabola LiveISO ? if so, which one?

are you installing from a Parabola LiveISO ? if so, which one?

I am installing from a liveISO, specifically the one with the name 'parabola-openrc-2017.09.30-dual.iso'.

Edit: In addition, I believe there should be a mention that the user should update time through the following commands to avoid the "Invalid/corrupt package" error.

```
nptd -qg  
hwclock -w
```

Finally, pacman -Syuu helped me fix the issue as well (but I believe that is pointed out in the docs).
