Description Greetings. After the most recen update of MESA, the XFCE Window Manager (XFWM) and some another desktop enviroments (Kodi interface, if example) chrash and return to the login screen. However, this issue is not affected by another window managers (Openbox). Exist a solution to make XFCE desktop working again? Thanks.

mesa-18.0.4-1.parabola1 was released. This solves your problem?

#2 - 2018-06-01 04:56 AM - eliotime3000

I'll update tomorrow until wait that new FFMPEG package arrives with the dependence of the new x265 version.

Actually, with the parabola1 update, the result is the same with XFCE4 desktop and Kodi (login screen loop). With Openbox, eveything is OK. I'm waiting with the update of parabola2 update if the MESA issue solves the issue.

Acutally, I'm using nouveau for my GeForce 210, and I'm reinstalling lightdm.

- Status changed from open to info needed

I have rebuilt kodi, however I do not understand what can be wrong with xfce.

#6 - 2018-06-14 06:04 AM - eliotime3000

SOLVED.

The main issue was with MESA, which the last update (18.1) practically works perfectly well. Thanks.
