Description I have an encrypted root partition (LUKS). Recently when it tries to boot up, right at the start screen when the master key is unlocking, I get these messages: Error: Invalid sector size 65535 Error: Invalid sector size 65535 Error: Invalid sector size 65535 Nothing bad happens from this as far as I can tell, everything boots as expected anyway.

What's the info needed?

#3 - 2018-09-11 06:07 PM - ani

I don't know what this was about. It hasn't happened now for ages so it's invalid.
