<b>Description</b> Oh My Zsh is an open source, community-driven framework for managing your zsh configuration. <a href="https://github.com/robbyrussell/oh-my-zsh">https://github.com/robbyrussell/oh-my-zsh</a> It's very nice to have this very useful tool for zsh

Took a look at this. Not sure this can really be made into a package in a useful way. it's just a bunch of ZSH config files designed to be git cloned or <cringe> sh -c "\$(curl..." 'd into the users \$HOME dir.

I suppose we could stow the files someplace appropriate and write a smallish activate-oh-my-zsh script but then would we be on the hook for a deactivate script.

It seems like it'd be more trouble to maintain then it's worse to save the user typing is a git command and a couple of initialization commands. (because hopefully no sane user would take the curl option)

I agree. A user downloading a command line framework should be at least willing to learn the commands to install it. What we could do is to package the install.sh script.

To address this issue, I created the stub wiki page [https://wiki.parabola.nu/Oh\\_My\\_Zsh](https://wiki.parabola.nu/Oh_My_Zsh). The page is mainly meant to collect all free plugins.

I did not quickly find an elegant way to install it without curl/wget, so I let it as it is.

Feel free to add plugins to the list and further improve the wiki page.
