|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| Status: fixed | % Done: 100% |
| Priority: bug | |
| Assignee: lukeshu | |
| Category: | |
| Description | |
| From the db-update step: | |
| <pre>Sep 23 08:13:16 db-import-pkg[23947]: ==> ERROR: Package community/catdoc-0.95-1.1-i686.pkg.tar.xz already exists in another repository Sep 23 08:13:16 db-import-pkg[23947]: ==> Removing left over lock from [community] (i686) Sep 23 08:13:16 db-import-pkg[23947]: ==> ERROR: An unknown error has occurred. Exiting... Sep 23 08:13:16 systemd[1]: db-import@archlinux32.service: Main process exited, code=killed, statu s=10/USR1</pre> | |
| This is caused by the fact that /srv/repo/main/pool/archlinux32/catdoc-0.95-1.1-i686.pkg.tar.xz exists but isn't part of any repo, but hasn't been cleaned up yet (db-cleanup should claim it at next run). | |

History

#1 - 2018-09-24 06:43 AM - lukeshu

Maybe add a step between db-move and db-update that calls db-repo-add on packages present in the pool but not present in other repos?

#2 - 2018-09-24 09:33 PM - lukeshu

Or just have \$PKGPOOL as an implicit member of INHERIT=(), and modify db-update to allow that.

#3 - 2018-09-25 01:44 AM - lukeshu

- % Done changed from 0 to 100

- Assignee set to lukeshu

Fixed in v20180924.

#4 - 2018-09-25 01:44 AM - lukeshu

- Status changed from open to fixed
