Description			
this can be done with `gpg --verify public/\$repo/os/\$arch/\$pkgname-\$pkgver-\$pkgrel.pkg.tar.?z.sig` but you know :P			

History

#2 - 2012-11-01 12:21 AM - mtjm

Do we need another script for this? Having developers to learn gpg --verify seems more useful. I don't remember any cases of invalid signatures (all such errors resulted from caching a different package).

#3 - 2012-11-19 07:41 AM - fauno

I use it to check who packaged something when db-update complains about already released packages ("on another repo").

#4 - 2012-11-20 06:20 AM - mtjm

I use tar xOf public/....tar.xz .PKGINFO, it works even in the case of bad or missing signatures.
