[light-locker] blackscreen

2019-01-25 10:28 PM - anon7mous

Status: info needed	% Done: 0%
Priority: bug	
Assignee:	
Category:	
Description If I select in the XFCE settings: ☐☐ Lock screen when the system goes into sleep mode. ☐☐ Lock the screen before entering sleep mode. and turn on the PC, the screen content is shown briefly, then the screen is locked and I am on the lightdm-loginscreen. Now I enter my password, so he unlocks, but I am only on a black screen with flashing cursor. I had the same problem with lightdm when I started it with xdm. My workaround was: <pre># mkdir /var/lib/lightdm # chown lightdm:lightdm /var/lib/lightdm # chmod 1770 /var/lib/lightdm # mkdir /var/lib/lightdm-data # chown lightdm:lightdm /var/lib/lightdm-data # chmod 1770 /var/lib/lightdm-data</pre>

which arch?
openrc or systemd?

Does anybody use this with systemd and could take a look at the needed files?
