Description

This is a minor bug that happens on my laptop which runs a x86_64 Parabola GNU/Linux-libre OS. I have three panels on XFCE screen space, the right most one is a vertical panel with a workspace switcher, a timer (bug concerning), a clock and a calendar. I use "Deskbar" as Panel Display Mode and the timer plugin is taking up space above and below which is not necessary and expands the panel when there is no point. I think that the user adds expansion separators to expand and thus the plugin should not.

See attached screenshot for an example.

this is likely because the developer of that plugin never tried it in vertical mode - i have noticed that with some of the lxpanel plugins
