Description	
<p>When shutting down the system gets stuck and will not proceed. Here is the output for all 3 kernel types.</p> <pre>sudo shutdown now [user@parabola] sudo shutdown now [sudo] password for user: /usr/bin/openrc-shutdown --single now PID1: Recieved "single" from FIFO... Starting single runlevel [user@parabola] * Stopping local ... [ok] * Saving random seed ... [ok] * Stopping NetworkManager ... [ok] * Stopping dbus ... ModemManager[1997] <warn> Could not acquire the 'org.freedesktop.ModemManager1' service name ModemManager[1997] <info> ModemManager is shut down [ok] * Unmounting loop devices * Unmounting filesystems * Deactivating swap devices ... [ok] * Setting hardware clock using the system clock [UTC] ... [ok]</pre> <p>Note: this output was copied by typing it out as I'm not sure how to output shutdown to a log file. I did try using &> as a redirect but it did not work. Also I changed the user and host name on the output. The output was also copied from linux-libre kernel, but I'm pretty sure all shutdowns are identical.</p> <p>On all kernels, if I hold down the shutdown button it will eventually turn off. During the shutdown hang I can switch tty's but none of the tty's will respond to keyboard input.</p> <p>Also I think once while holding shutdown on linux-libre-hardened it managed to complete the rest of the shutdown sequence. I could let go of the shutdown button and it would finish it off. However, I am unable to replicate this.</p> <p>There are some other related issues that I found but nothing exactly like this.</p> <p>I can provide more info if needed.</p> <p>It's also worth noting that I have just installed this system yesterday too.</p> <p>Current system info:</p> <ul style="list-style-type: none">• <code>uname -a</code>: Linux <hostname> 5.0.5-gnu-1 #1 SMP PREEMPT Thu Mar 28 21:36:12 UTC 2019 x86_64 GNU/Linux• Device: ThinkPad T400 with Libreboot• Parabola version: Parabola OpenRC Cli

Don't worry I found a fix.

Apparently on openrc to shutdown you must use

```
# openrc-shutdown -p
```

#2 - 2019-04-07 08:40 AM - bill-auger

- *Status changed from unconfirmed to not-a-bug*

#3 - 2019-04-07 08:48 AM - bill-auger

sinaptik -

i could not help but notice that the three bug reports you opened this week were not actually bugs; but essentially requests for help because you did not read the documentation - asking for help is fine; but general support questions should be asked on the [assist] mailing list - it is best to reserve the bug tracker for bugs and feature requests (tasks where there is a goal and progress that is "tracked")
