[clementine] needs qt5 build

2019-05-05 11:24 PM - CommodoreCrunch

Status:	not-a-bug	% Done:	0%
Priority:	bug		
Assignee:	ovruni		
Category:			
Description As the qt4 dependencies have been removed from Arch's repositories, a rebuild is needed against qt5 equivalents such as qt5-base and liblastfm-qt5, otherwise the user must install legacy qt4 libraries from the AUR or elsewhere to use Clementine. If the changes to the Arch package are any indication, this upgrade requires switching the source to a particular git branch. In such a case, patches such as the non-free artwork removal will require fuzzing.

what arcitecture are you on?

#2 - 2019-05-06 12:42 AM - CommodoreCrunch

I'm on x86_64.

Yep, saw the mess you are talking about while waiting for you to reply. I've just been busy with a lot of i686 stuff due to massive updates there and thought this might be part of that.
marking as confirmed
