Description I see that upstream packages coreboot-utils from Coreboot: https://aur.archlinux.org/packages/coreboot-utils/ It is GPLv2 (supposedly). It is a useful piece of software for those running systems that utilize Coreboot or (its downstream distro) Libreboot.

I tried to do an nvramtool package some time ago but I failed.

The issue is that I tried to keep only the util/nvramtool directory in the Coreboot source code, to make sure all the code was free software, but that didn't work out.

The main Coreboot source code probably still contains nonfree software like the SMU firmware.

Denis.
