someone else had this problem last week - it has something to do with the qt5ct GTK theme, or some combinatino of themes

try deleting the qt5ct config

```
$ rm -rf ~/.config/qt5ct
```

if that does not help, try selecting a different GTK theme with lxappearance; or selecting a different qt5ct theme using the qt5ct program, something other than 'GTK2' like "fusion"

NOTE TO SELF: i think maybe 'qt5-styleplugins' needs to be rebuilt

Thank you very much!

Now I can start vlc, gqrx and calibre :3
