<b>Description</b>	
Hi!	
I am getting some warnings about /etc/profile.d/perlbin.sh (core/perl 5.32.0-1). The warning says that append_path was not found. I seem to remember that append_path would just add something to PATH. I am using OpenRC. (See also perlbin.csh).	
Cheers!

- Description updated

which steps would be needed for someone to reproduce the error message?

#### #2 - 2021-06-04 05:20 PM - nona

What? did I really post an empty bug? No! I am sorry. I remember to have described that perlbin.sh shows an error regarding a missing append\_path. May be I forgot to hit send? (unlikely, since the bug report was created).

Anyway:

On boot (OpenRC), I see an error saying something about a missing append\_path. I am familiar with that function, and remembered that it came from the scripts in profile.d. When I checked the files over there, I saw that perlbin.sh had append\_path. In the back of my head, something told me that this was a convenience function to add a directory to the PATH variable. I fixed it by defining PATH manually, instead of using append\_path.

Sorry for missing the description. I don't know what happened.

sry, i erased the OP accidentally

#### #4 - 2021-06-04 07:34 PM - nona

No worries. Since I still see the "info needed" tag, I didn't really do anything. When I boot, I see the warning on the OpenRC notices. I guess that to reproduce the problem, you would install OpenRC and perlbin.sh, turn on the computer and look at the messages prior to the OS initialisation. In my case, I just modified the file, and the error is gone.

#### #5 - 2021-08-15 02:57 PM - nona

The bug is back. If you want more info, let me know what that would be, please.

#### #6 - 2021-09-11 02:06 AM - nona

- Status changed from info needed to not-a-bug

My system had a very old version of /etc/profile. This file from the filesystem package defines append\_path.
