Description Hello Parabola team, This is yet another request from a to-be-Parabola user. Since Parabola users are generally concerned about privacy, we use softwares like XMPP, Jami, and Matrix for chatting with our beloved ones, I would like to include these two software to the Parabola repositories: Schildichat and nheko-reborn. Nheko-reborn is a Matrix client written in Qt/C++ instead of electron like Element. And it's licensed under GPLv3. But, unfortunately, it uses k-lite codec for decoding media, especially in windows, whereas GNU/Linux users can use alternatives free software for that purpose. Schildichat is a fork of Element-desktop which is used by people like me who want the features of Element but without the telemetry included in it. So, I hope you include these two softwares in your repositories. Thank you.

I am not a Parabola developer. However, can you confirm that SchildiChat is free from qt5-webengine?

Parabola blacklisted all packages that depend on qt5-webengine by [#1167](#).
