Description

On armv7h wget fails to verify the certificates:

```
$ wget https://parabola.nu
--2022-03-30 14:56:30--  https://parabola.nu/
Loaded CA certificate '/etc/ssl/certs/ca-certificates.crt'
Resolving parabola.nu (parabola.nu)... 93.95.226.249, 2001:470:1f09:96::2
Connecting to parabola.nu (parabola.nu)|93.95.226.249|:443... connected.
The certificate has not yet been activated
$ echo $?
5
```

But curl works fine:

```
$ curl https://parabola.nu
<html>
<head><title>301 Moved Permanently</title></head>
<body>
<center><h1>301 Moved Permanently</h1></center>
<hr><center>nginx/1.16.1</center>
</body>
</html>
```

And wget also works fine on x86_64

Bill Auger was also able to reproduce the bug.

it is curious that this does not affect curl - lucky that is does not; because pacman relies on curl by default
