there is a new package 2.6.2 in pcr-testing - the reported bug is fixed; but i cant get it to work - i can never remember how to start this program - i tried all of these program - i tried all of these commands (three different "wad" packages):

```
$ prboom-plus /usr/share/prboom-plus/prboom-plus.wad
$ prboom-plus -iwad /usr/share/prboom-plus/prboom-plus.wad
$ prboom-plus /usr/share/games/doom/freedoom1.wad
$ prboom-plus -iwad /usr/share/games/doom/freedoom1.wad
$ prboom-plus /usr/share/games/doom/freedoom2.wad
$ prboom-plus -iwad /usr/share/games/doom/freedoom2.wad
$ prboom-plus /usr/share/games/doom/freedm.wad
$ prboom-plus -iwad /usr/share/games/doom/freedm.wad
```

The testing package works without issue for me. All of those commands also work except for

```
$ prboom-plus -iwad /usr/share/prboom-plus/prboom-plus.wad
```

- Status changed from confirmed to fixed

not sure why i cant get it working; but the i686 package works fine for me under QEMU

```
$ prboom-plus /usr/share/games/doom/freedm.wad
```
