Hello.
Detailed information about the package can be found in the [package section](#)
For package "kimagemapeditor" is https://www.parabola.nu/packages/extra/x86_64/kimagemapeditor/
In Dependencies section you can see that package "qt5-webengine" is a virtual package.

<https://wiki.archlinux.org/title/pacman> A virtual package is a special package which does not exist by itself, but is provided by one or more other packages. Virtual packages allow other packages to not name a specific package as a dependency, in case there are several candidates. Virtual packages cannot be installed by their name, instead they become installed in your system when you have installed a package providing the virtual package.

To install a virtual package, indicate needed parameter when installing the main package:

```
$ pacman -S <package> --assume-installed <virtual-package>
$ pacman -S kimagemapeditor --assume-installed qt5-webengine

$ pacman -S --help
    --assume-installed <package=version>
                        add a virtual package to satisfy dependencies
```
