

libretools - Bug #380

[libremakepkg] \$PKGDEST is a binary file

2013-08-08 12:52 PM - lluvia

Status: fixed	% Done: 100%
Priority: bug	
Assignee: lukeshu	
Category:	
Description	
<p>When uncommenting some vars like PKGDEST or SRCDEST and leaving the defaults, I would expect that directories were created and that they contains the expected files. However, they appears as files. For example, try building your-freedom creates a /home/sources wich is a copy of blacklist*.txt file, and building widelands /home/packages becomes a binary file and /home/sources the launcher of the binary (a sh script).</p> <p>I though that maybe the script is doing `cp file \$SRCDEST` before assuring \$SRCDEST (or other) is an existing directory.</p> <p>I attach my libretools.conf and makepkg.conf.</p>

That's definitely what's going on. I **think** switching to the new devtools will fix this, but I'll check when I do it, and if not, I'll fix it.

#3 - 2013-09-14 05:42 PM - lukeshu

This was not fixed by devtools, but I fixed it with a call to `mkdir` in the same commit that I updated to the new devtools
