[labs] mail notifications have implicit destination

2013-12-29 01:27 PM - mtjm

Description Mailman puts all notification emails sent to the dev list in its moderation queue with the reason "Message has implicit destination". Disabling "Blind carbon copy recipients (bcc)" solves this, but it leaks emails of all subscribers in the mail sent to the list. Is it ok? Can it be fixed to send a separate mail with the user in the To header? Or is it a mail server issue?

Here's what I think is happening:

To:
Cc:
Bcc: list users...

What needs to happen:

To: list
Cc:
Bcc: users...

I could be mistaken on what is currently happening (I don't think I'm currently a moderator on the list, to check). Whatever the case, the list needs to be in "To" or "Cc", while individual users should be in "Bcc".
