<b>Description</b>			
It seems that python-virtual via pip call to install non-free stuff list on <a href="http://pypi.python.org">http://pypi.python.org</a> At this time the possible issue is to modify directly pip ::  install the python virtualenv  modify ~/.vir*/lib/pyt*/site-packages/pip*/pip/commands/install.py you should modify the search.py to on the line corresponding to the target website  <pre>import py_compile py_compile.compile('install.py')</pre> to replace the .pyc corresponding  then copy modify the <a href="http://pypi.python.org/simple/">http://pypi.python.org/simple/</a> and the page correspondant to each software keep the md5 (needed as explain <a href="http://peak.telecommunity.com/DevCenter/EasyInstall#package-index-api">http://peak.telecommunity.com/DevCenter/EasyInstall#package-index-api</a> )  works on it at this time ... hope to find a better issue  files which should be concerned  This link should be replaced by a free repository  pip/commands/install.py (pypi.python.org/simple) line 52 pip/commands/search.py (pypi.python.org/simple) line 25 pip/index.py (last.pypi.python.org) line 29  index.py also suggest line 351 and 352 to keep the name simple (maybe we can change here to free) which mean a possible complete and correct rebranding to freedom  end of visiting /pip and /pip/commands  it seems we need a sort of repository like last.pypi.python.org + free list + modifying the source codes as above.			

History

Here is a testing solution (works!)

As said on the part above modify the install.py

and use :: <http://pbot.dyndns.org:8000/simple/>

at this time it have just some packages to test

The best should now a better place somewhere on the www because this server is not very fast.

then try

pip install a8

as you can see it get the code ... if you try another package which is not in the list, it will not goes to pypi.
