Is your setuptools installed for the same Python version? (E.g. for 3.4 or 3.5 or 2.7.)

If I run python --version I get the following error:

```
python: error while loading shared libraries: libpython3.4m.so.1.0: cannot open shared object file: No such file or directory
```

It seems that ldconfig is wired for python3.5 but some programs are looking for 3.4 instead.

It seems that ldconfig is wired for python3.5 but some programs are looking for 3.4 instead.

Duh, I found out the culprit: hardwired python compiled from last September, probably when I needed this version but it wasn't yet available or something weird like this. Removed the extra python, all is well.

#4 - 2015-10-21 10:43 PM - hellekin

BOGUS ISSUE (but can't close it)

#5 - 2015-10-21 10:50 PM - hellekin

Had to resintall both python-setuptools and python-packaging after I removed my extra python binaries. **NOW FIXED.**
