Description	
Hi,	
it seems that arch has an architecture named "any" for architecture-independant packages. https://www.archlinux.org/packages/?arch=any	
We don't.	
Is it an issue? Or is it me that uses stable repositories instead of the -testing ones?	
Denis.

We do, <https://www.parabola.nu/packages/?arch=any>, but it's not a real architecture: just the same package files are available for several architectures.
